

Photo Linking & Images Addendum

Version 2.1

The workbook now keeps every inventory row linked to its source photo through static identifiers. This addendum explains the new fields and the visual-reference fallback.

Recommended workflow

1. Fix the upload order

Keep the original filenames. The first uploaded image is Photo 001, the second is Photo 002, and so on. Twenty or more photos use the same three-digit sequence.

2. Keep one ID per stamp record

Use REC-0001, REC-0002, and so on. These are static text values, so sorting or filtering does not change the link.

3. Repeat the source link

Every stamp found on the same image repeats that image's Photo Number and Original Filename.

4. Handle repeat views

When one physical stamp appears in several images, list all IDs in photo_references, such as Photo 001; Photo 004. Use a separate reference row if you are not certain it is the same stamp.

5. Add a visual reference

Prefer a close crop when it is reliable. Paste it into the matching Images row. Otherwise paste a small source-photo thumbnail.

6. Use the fallback honestly

If no image can be embedded, leave the image area blank and retain Record ID, Photo Number, Original Filename, position, and a clear fallback note.

Workbook fields

Inventory adds record_id, photo_number, original_filename, photo_references, and stamp_image_reference. Per photo and Progress add Photo Number. Images provides a stable lookup area with Record ID, Photo Number, filename, status, and room for a crop or thumbnail.

Image size guidance

Use a crop or thumbnail around 160 x 120 pixels when practical. Compress large photos before pasting. Keep one small visual per record row to avoid an excessively large workbook. Standard embedded pictures are most reliable in desktop Excel; Google Sheets and LibreOffice may position or scale them differently.

Technical limitation

This product is a static Excel-and-prompt toolkit, not an upload-processing web application. It cannot automatically pull crops from AI chat output into Excel. The new workflow preserves the photo link and provides a prepared Images sheet; crop or thumbnail insertion depends on the AI tool or a manual paste step.

Verification checklist

- Multiple stamps from one image share one Photo Number. - Twenty or more uploads keep sequential numbers. - Every populated stamp row has a static Record ID. - Multiple views are recorded in photo_references. - Missing image data has an explicit fallback note. - Sorting and filtering do not alter identifier text.
